

Eddie,

See Below answers to your questions and the additions I have on top.

1. Needs to be a tab up top for **Advanced Care Planning** that links to website MyDirectives so they can fill out their online advanced care planning document.  
<https://www.mydirectives.com/>
2. Ill need to contract with a telehealth company to see If we can add them to the top for telehealth services. I should be able to see what telehealth providers are covered by the insurance plans of the company and I can just add the link to the APP for ease of use for the organization
3. I need a third party administrator to process all the payments if we are to try and receive the full tax credit of 14,000 per employee. They would then need to diversify the funds, apply tax credit, and properly diversify the funds.
4. I need to have a monthly educational email that goes out as well. I will work on the wording and send to you as soon as I can. But I'd like it to pertain to topics of
  - A) B vitamin deficiency,
  - B) B)Holistic approach the acute illness,
  - C) C)metabolic health,
  - D) Diet and exercise,
  - E) Vitamin D deficiency for October prior to winter and flu season,
  - F) Hormone Health Male/Female email linked to initial account
  - G) Sleep
  - H) Stress control
  - I) Detox
  - J) Inflammation

Drawing a blank for two more but will come up with it and get them to you

5. This should be the last of it the only other concern is if al values are out of range having a message or video that expresses concern of the values and recommendations to seek evaluation by your health care provider if all ranges are High for the triglycerides/HDL ratio, HOMA IR and HSCR

## The Two Ideas Work Together

The app can be totally free for individuals AND still do everything you were planning with employers. Here's the simple version:

Anyone signs up and gets full access — labs, BHAS score, resources, supplements. No cost, no

strings.

Employees can optionally connect to their employer's org by entering a private invite code. Once they do, their employer can see the employer's health data — but never individual names, lab values, or anything personal. That part's already built.

Employers pay you — for your consulting and physician oversight, not for the app. The app is your lead gen and data collection tool. You're selling your expertise, not software subscriptions.

Honestly this is a stronger model. Free app grows the brand and the user base. Employers see the value in the data and pay for your time on top of it.

**I like this Idea**

What We Can Drop

Since the app is free, a few things we had planned aren't really needed anymore:

In-app payment processing — you'll just bill employers directly-**agree**

**HSA bank integration — can revisit down the road if needed-ok can we have a section for forms that has a premade form filled out for medical reimbursement-I believe I sent you a pre-made form already. I'd like it to be easy for employees to get their Gym memberships/exercise equipment/easily approved though filling out a form that has a click box that has insulin resistance/ metabolic syndrome/family history of cardiac disease/anxiety-depression/able to check to**

**Employer invoicing through the app — not a priority right now-Might actually need this important for Lab reimbursement with my first company as they are considering covering it.** Everything else stays exactly as planned.

A Few Things I Need From You

1. How private should the org join be?

When an employee joins their employer's org, should the org admin be able to see which employees signed up (by work email) — or should it be fully anonymous where the org only ever sees usernames?

Option a (fully anonymous): Employee enters the invite code, shows up in the org as a username. Org admin never knows who's who. **I like this but I also want to be able to add a reward like cash benefit to their account if they hit certain metrics at discretion of employer. This may have to be done through a third party administer that goes right into their payroll though? But how would I be able to let them know that they have completed their assessments would likely be through email address so the below might be more appropriate**

as long as it doesn't divulge any health information or ID numbers associated with the email account.

Option B (email visible): Org admin can see which work emails have enrolled.  
I'd go with Option A — simpler, more private, and fits the whole de-identified approach we've been building. But want to make sure that's what you had in mind.

## 2. Health assessment wording

for the yes/no health check-in, I just need your take on how to phrase a few of the questions:

Sleep — something like "Do you get 7–9 hours of sleep most nights?"

Stress — something like "Is your stress generally manageable day to day?"

Exercise/**Movement** — something like "Do you exercise at least 150 minutes per week?" **Is you're Job Sedentary**

Alcohol — "Do you currently drink alcohol?" or is there a specific threshold you care about clinically? **Do you drink more than one alcoholic beverage daily**

Smoking — "Do you currently smoke or use tobacco?"

Also two bigger ones on the assessment:

Does it affect the BHAS score at all, or is it just tracked separately? **Separately tracked**  
how often should users fill it out — once at signup, quarterly, or every time they log new labs?

## 3. Virtual provider links

you mentioned being able to filter providers by state eventually. For the initial build, should it be org-specific (each employer has their own provider list) or one universal list for all NHL users? **I like that each organization has their own provider list but I am going to work on trying to get contracts with a tale-health provider that is national to integrate into the APP. Then I need to get with a Third Party Administer TPA to manage all the claims and process all the money and we should then be compliant with the IRS tax codes possibly.**

Thanks

Eddie
